## 1、工作电压

薄膜电容的选用取决于施加的最高电压，并受施加的电压波形、电流波形、频率、环境温度（电容器表面温度）、电容量等因素的影响。使用前请先检查电容器两端的电压是否在额定值内。

## 2、工作电流

通过电容器的脉冲（或交流）电流等于电容量C与电压上升速率的乘积，即 $I=Cxdv/dt$ 。

由于电容器存在损耗，在高频或高脉冲条件下使用时，通过电容器的脉冲（或交流）电流会使电容器自身发热而有温升，将会有热击穿（冒烟、起火）的危险。因此，电容器安全使用条件不仅受额定电压（或类别电压）的限制，而且受额定电流的限制。

额定电流被认为是由击穿模式决定的脉冲电流（峰值电流、即由 $dv/dt$ 指标所限制的）和连续电流（以峰值或有效值表示）组成，当使用时，需确认这两个电流都在允许范围之内。

## 3、电容器充放电

由于电容充放电电流取决于电容量和电压上升速率的乘积，即使是低电压充放电，也可能产生大的瞬间充放电电流，这可能会导致电容器性能的损害，比如说短路或开路。当进行充放电时，请串联一个 $20\Omega/V \sim 1000\Omega/V$ 或更高的限流电阻，将充放电电流限制在规定的范围内。

当多个薄膜电容器并联进行耐电压测试或寿命测试时，请为每个电容器串联一个 $20\Omega/V \sim 1000\Omega/V$ 或更高的限流电阻。详见电容器标准。

## 4、阻燃性

尽管在薄膜电容器外封装中使用了耐火性阻燃材料—阻燃环氧树脂或塑壳，但外部的持续高温或火焰仍可使电容器芯子变形而产生外封装破裂，导致电容器芯子熔化或燃烧。

5、表面温升（ $\Delta T$ ）

当电容器用于交流及脉冲场合时，流经电容器的电流使其发热，如果发热量过大，会导致电容器短路甚至燃烧。所以流经电容器的电流不能超过产品目录所规定的最大数量及电容器在加载时监测温升就显得尤为必要。

## 1、Operation Voltage

The Film Capacitor varies in the maximum applicable voltage depending on the applied voltage waveform, current waveform, frequency, ambient temperature (capacitor surface temperature), capacitance value, etc. Be sure to use capacitors within the specified values by checking the voltage waveform, current waveform, and frequency applied to them (In the application of high frequency, the permissible voltage varies with the type of the capacitor).

## 2、Operating Current

The pulse (or AC) current flowing through the capacitor is expressed as:  $I=Cxdv/dt$ .

Due to the fact that dissipation factor of the capacitor will generate the internal heat under the application of high frequency or high pulse current, temperature rise in it will occur and may cause deterioration of with rated voltage, even lead to break down (smoking or firing).Therefore, the safety use of capacitor must be within the rated voltage (or category voltage) and the permissible current.

The rated current must be considered by dividing into pulse current (peak current) and continuous current depending on the break down mode, and when using, should make sure the both currents are within the permissible values.

## 3、Charging and discharging

Because the charging and discharging current of capacitor is obtained by the product of voltage rise rate( $dv/dt$ )and open due to sudden charging and discharging current.When charging and discharging current.when charing and discharging ,Pass through a resistance of  $20\Omega/V$  to  $1000\Omega/V$  or more to limit current.

When connecting multiple film capacitors in parallel in withstand voltage test or life test,connect a resistance of  $20\Omega/V$  to  $1000\Omega/V$  or more in series to each capacitor.(For detail see the specification)

## 4、Flame retardation (only to CBB60&amp;CBB61)

Although flame retardation epoxy resin or plastic case is used in the coating or encapsulating of plastic film cap. continuous outer high temperature or firing will break the coating layer or plastic case of the capacitor .and may lead to melting or firing of the capacitor element.

5、Surface overtemperature (  $\Delta T$  )

When capacitor is used in A.C.or pulse applications the current that flows through the capacitor makes it heat up.If the capacitor heats up too much it might deteriorate causing a short circuit or fire.It is essential that the limits described in the catalogue are not exceeded and that a temperature check on
